How to Increase Cancer Screening Rates in Practice

An Action Plan for Implementing a Primary Care Clinician’s* Evidence-based Toolbox and Guide

*Including family physicians, general internists, obstetrician-gynecologists, nurse practitioners, physician assistants, and their office managers
Improve Cancer Screening Rates
Using the Four Essential Strategies

1. Be clear that screening is important. Ask patients about their needs and preferences.

2. Involve your staff to make screening more effective.

3. Be Persistent with Reminders
   - Track test results, and follow up with providers and patients.
   - You may need to remind patients several times before they follow through.

4. Measure your progress to tell if you are doing as well as you think.

   - Create a simple tracking system that will help you follow up as needed.

   - Measure practice progress
     - Establish a baseline screening rate, and set an ambitious practice goal.
     - Seeing screening rates improve can be rewarding for your team.

   - Develop a screening policy
     - Create a standardized course of action.
     - Engage your team in creating, supporting, and following the policy.

   - A recommendation from you is vital.
Saving Lives through Cancer Screenings

Implement practice changes to achieve the four essentials and increase cancer screening rates.

Increasing screening saves lives. An evidence-based plan for your practice is below.

1. Take steps to identify and screen every age-appropriate patient.

Start with patients who are easiest to reach, and gradually incorporate groups that are less accessible:

- Patients who come in for regular checkups
- Patients who receive regular care for chronic conditions
- Patients who come in only when they have a problem
- Patients who are part of your practice, but almost never come in

2. Involve your staff, and put office systems in place.

Given the many demands on your time, getting a recommendation to every appropriate patient will happen only once the screening process occurs systematically.

3. Follow a continuous improvement model to develop and test changes.

**Develop your plan:** Together with your staff, develop a screening system based on the four essentials. If you already have a system, review your approach and identify opportunities for improvement. Establish a baseline screening rate before implementing changes.

**Do your plan:** Engage your staff in the plan, and make sure everyone on your team knows their role.

**Study your results:** Measure your screening rates, and meet with your staff regularly to review progress.

**Act on your results:** Based on your results, identify opportunities for further improvement. When you are ready, build on your plan and consider how to include harder-to-reach patient groups.
